

Building a Pentagonal Trapezohedron

Start by cutting along the outer edge of the template on the following page. Fold along the edges of all polygons, so that the shaded side is on the outside.

Glue the solid with a glue stick as instructed below. When you glue one face, press it together with your fingers and count slowly to 15. Then glue the next face of the solid.

Glue quadrilaterals A under the quadrilaterals B next to them. You then have two halves of a solid, which are joined on one side. Fold the small triangles to the inside so that they remain under the halves when the two halves are combined. There will be no glue on the triangles. One half has four quadrilaterals more than the other. Glue the four quadrilaterals over the other half.
